Falls Lake Monitoring Program

The information below provides downloadable files for the Falls Lake Monitoring Program sponsored by the UNRBA.

Monitoring Plan and Quality Assurance Project Plan:

-  [DWR Approved Monitoring Plan July 15 2014](#)
-  [DWR Approved Quality Assurance Project Plan \(QAPP\) July 30, 2014](#)
-  [Monitoring Site Map, Revised 11/02/15](#)
-  [2015 Annual Monitoring Report](#)
-  [2014 Annual Monitoring Report](#)
-  [2015 Interim Monitoring Report](#)
-  [2016 Interim Monitoring Report](#)

Interim Report

- Updates the previous annual report with data collected between January and June 2016
- These 6 months are consistent with data collected throughout the monitoring program.

Special Studies Updates

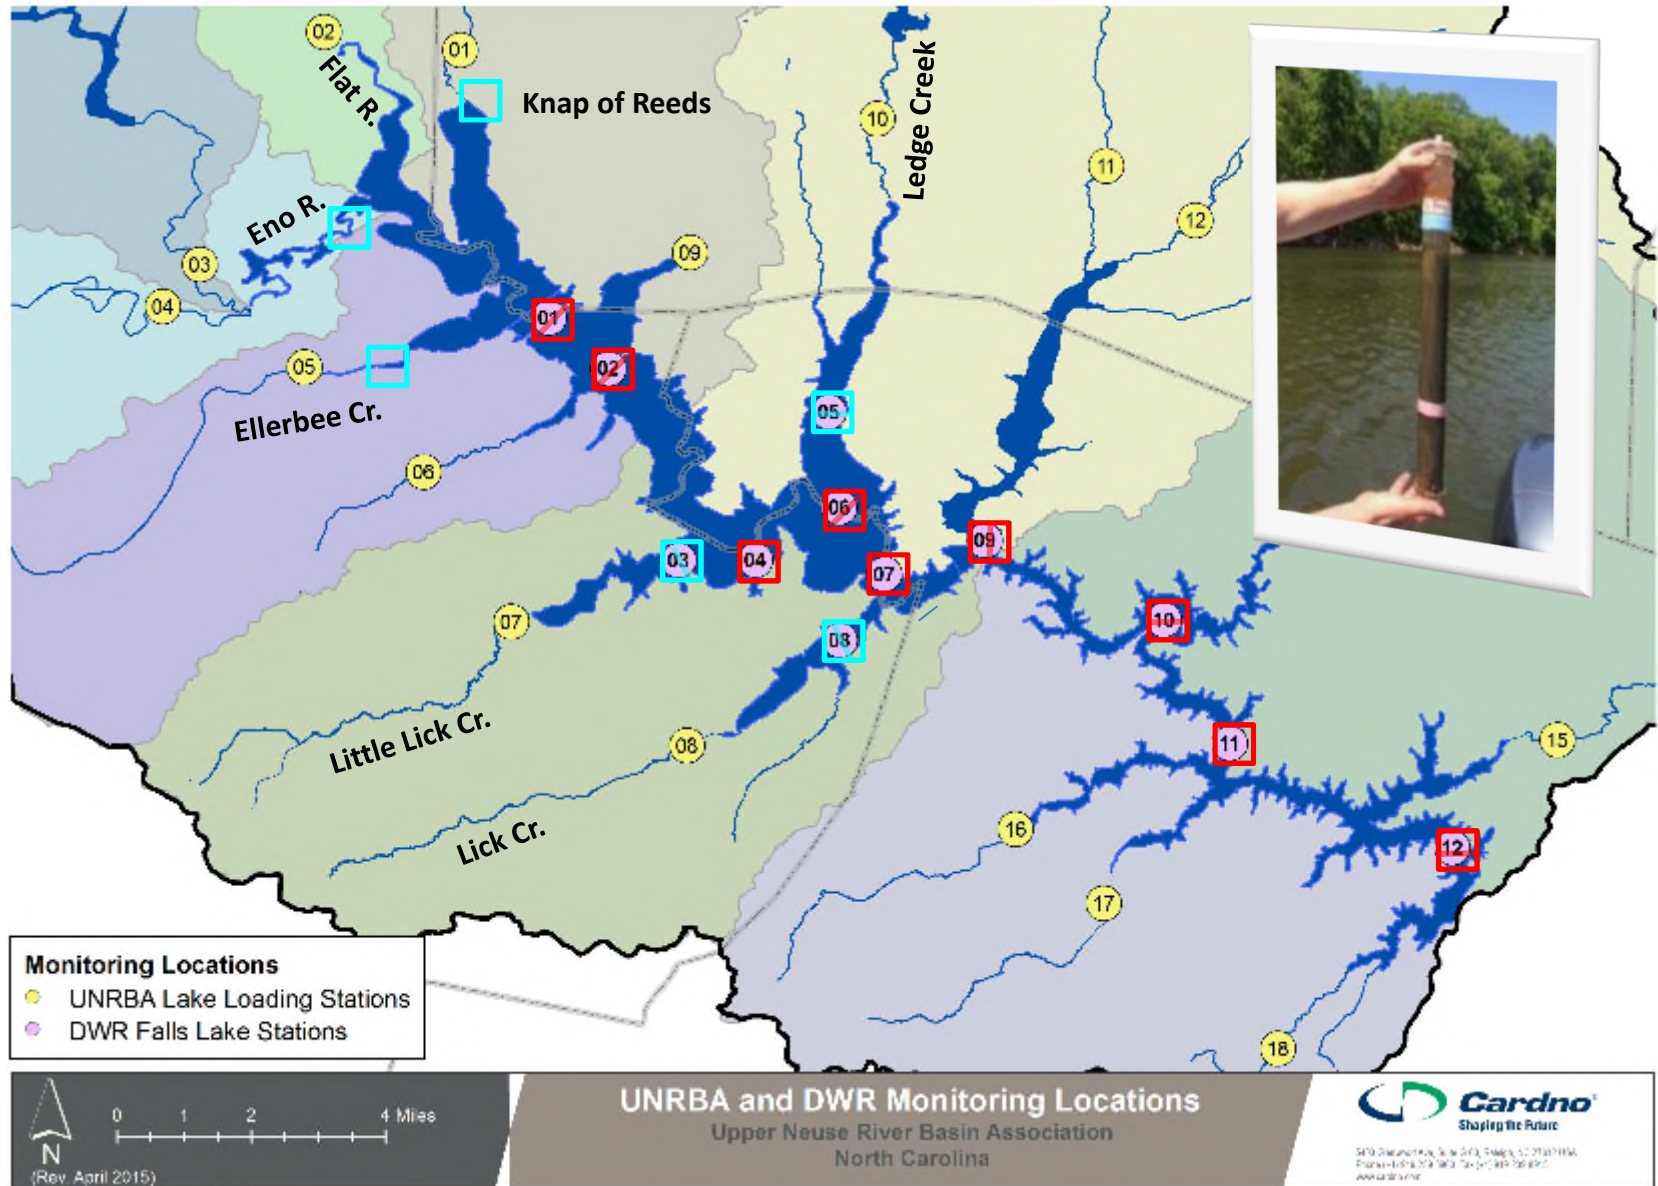

Sediment study:
How important are sediments as a source of nutrients?

Professor Marc Alperin
UNC-Chapel Hill
October PFC Meeting

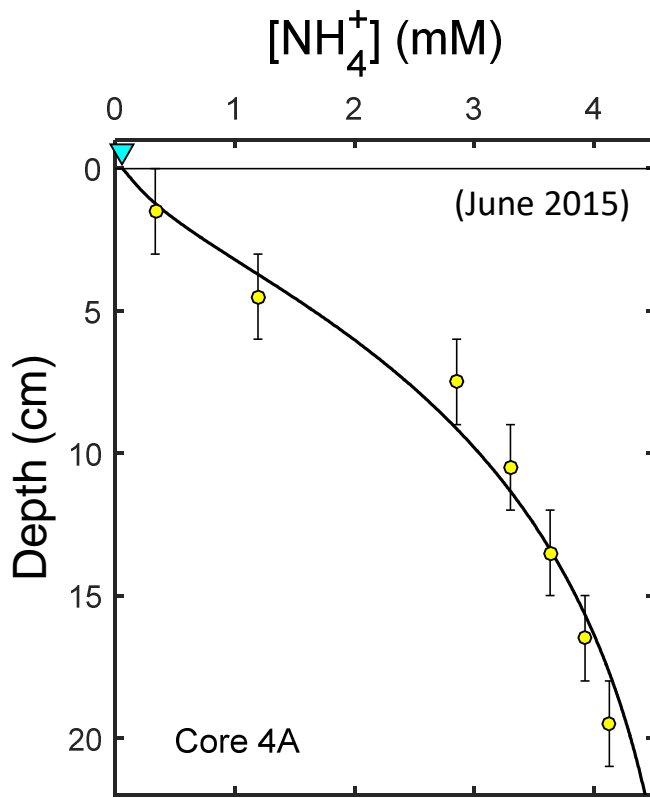

29 Cores; 9 "Transects"

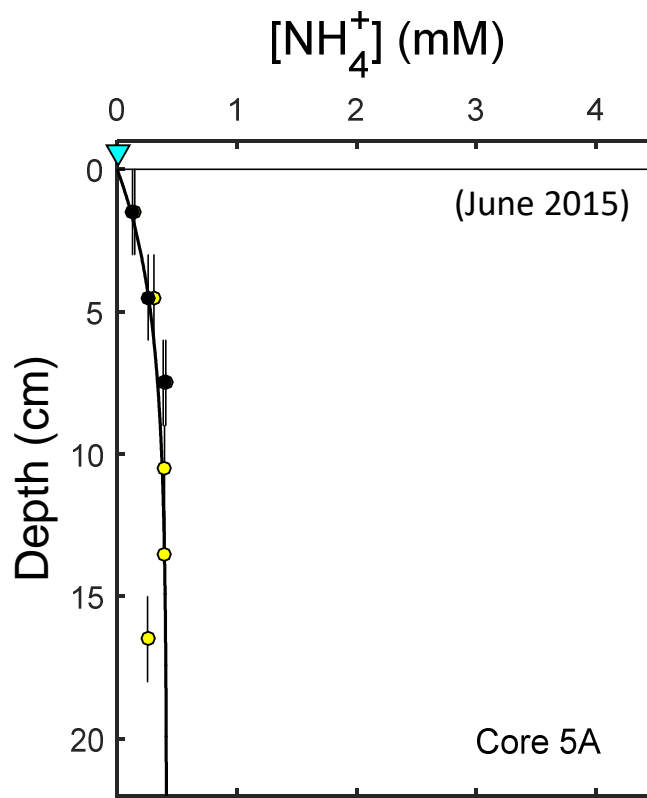

Red square icon: Neuse River Main Stem Stations

Blue square icon: Tributary (flooded) Stations

Sediment Flux:

$0.08 \text{ g N} \cdot \text{m}^{-2} \cdot \text{d}^{-1}$

$0.02 \text{ g N} \cdot \text{m}^{-2} \cdot \text{d}^{-1}$

General conclusions from sediment study

- **Significant variability** in flux estimates among locations
- Sediment ammonia release is **similar to total tributary N load**
- The sediments are a **nitrogen reservoir**; *even if tributary inputs were eliminated, it is estimated that it would take **25 years** to release just 85% of the stored N.*
