

**UNRBA – October 3, 2023**

# NC State Stormwater Research Update

Bill Hunt, PE, PhD  
WNR Professor & Extension  
Specialist  
Biological & Agricultural  
Engineering  
NC State University

# Aha! Moment

# Stormwater Quiz

- What is the Water Quality Design Storm?
- What does “First Flush” entail?

# Stormwater Quiz (continued)

- How dirty are our urban surfaces? (related: which ones are the biggest polluters?)

## DWR Asked Us to:

- Determine Pollutant Loadings from Pervious Land Uses
  - Managed Woods, Meadow, Managed Lawns
- To Calculate Pollutant Loadings, we need 2 things:
- Annual VOLUME of Runoff, and
- The Concentration of Pollutants (EMC's)

**By Measuring Event Runoff Volumes  
(& Precipitation Depths) to Determine  
Annual Runoff Volume, we can back-  
calculate...**

# The NRCS Curve Number !!!

$$Q^* = \frac{(P - 0.2 S)^2}{(P - 0.8 S)}$$

$$S = \frac{1000}{CN} - 10$$

- Where:  $Q^*$  = Runoff Depth (in)
- $P$  = Precipitation Depth (in)
- $S$  = Potential Maximum Soil Moisture Retention (in)
- $CN$  = Curve Number

# Rain Gauges! – Manual & Tipping Bucket

# Your WQ Workhorse: The Weir

Rectangular Weir

**Separated by  
a mere 2000  
years?**

*Roman Castellum Aquae in  
Nimes, France*

# Measuring Flow

RB IN  
Flowlink 5

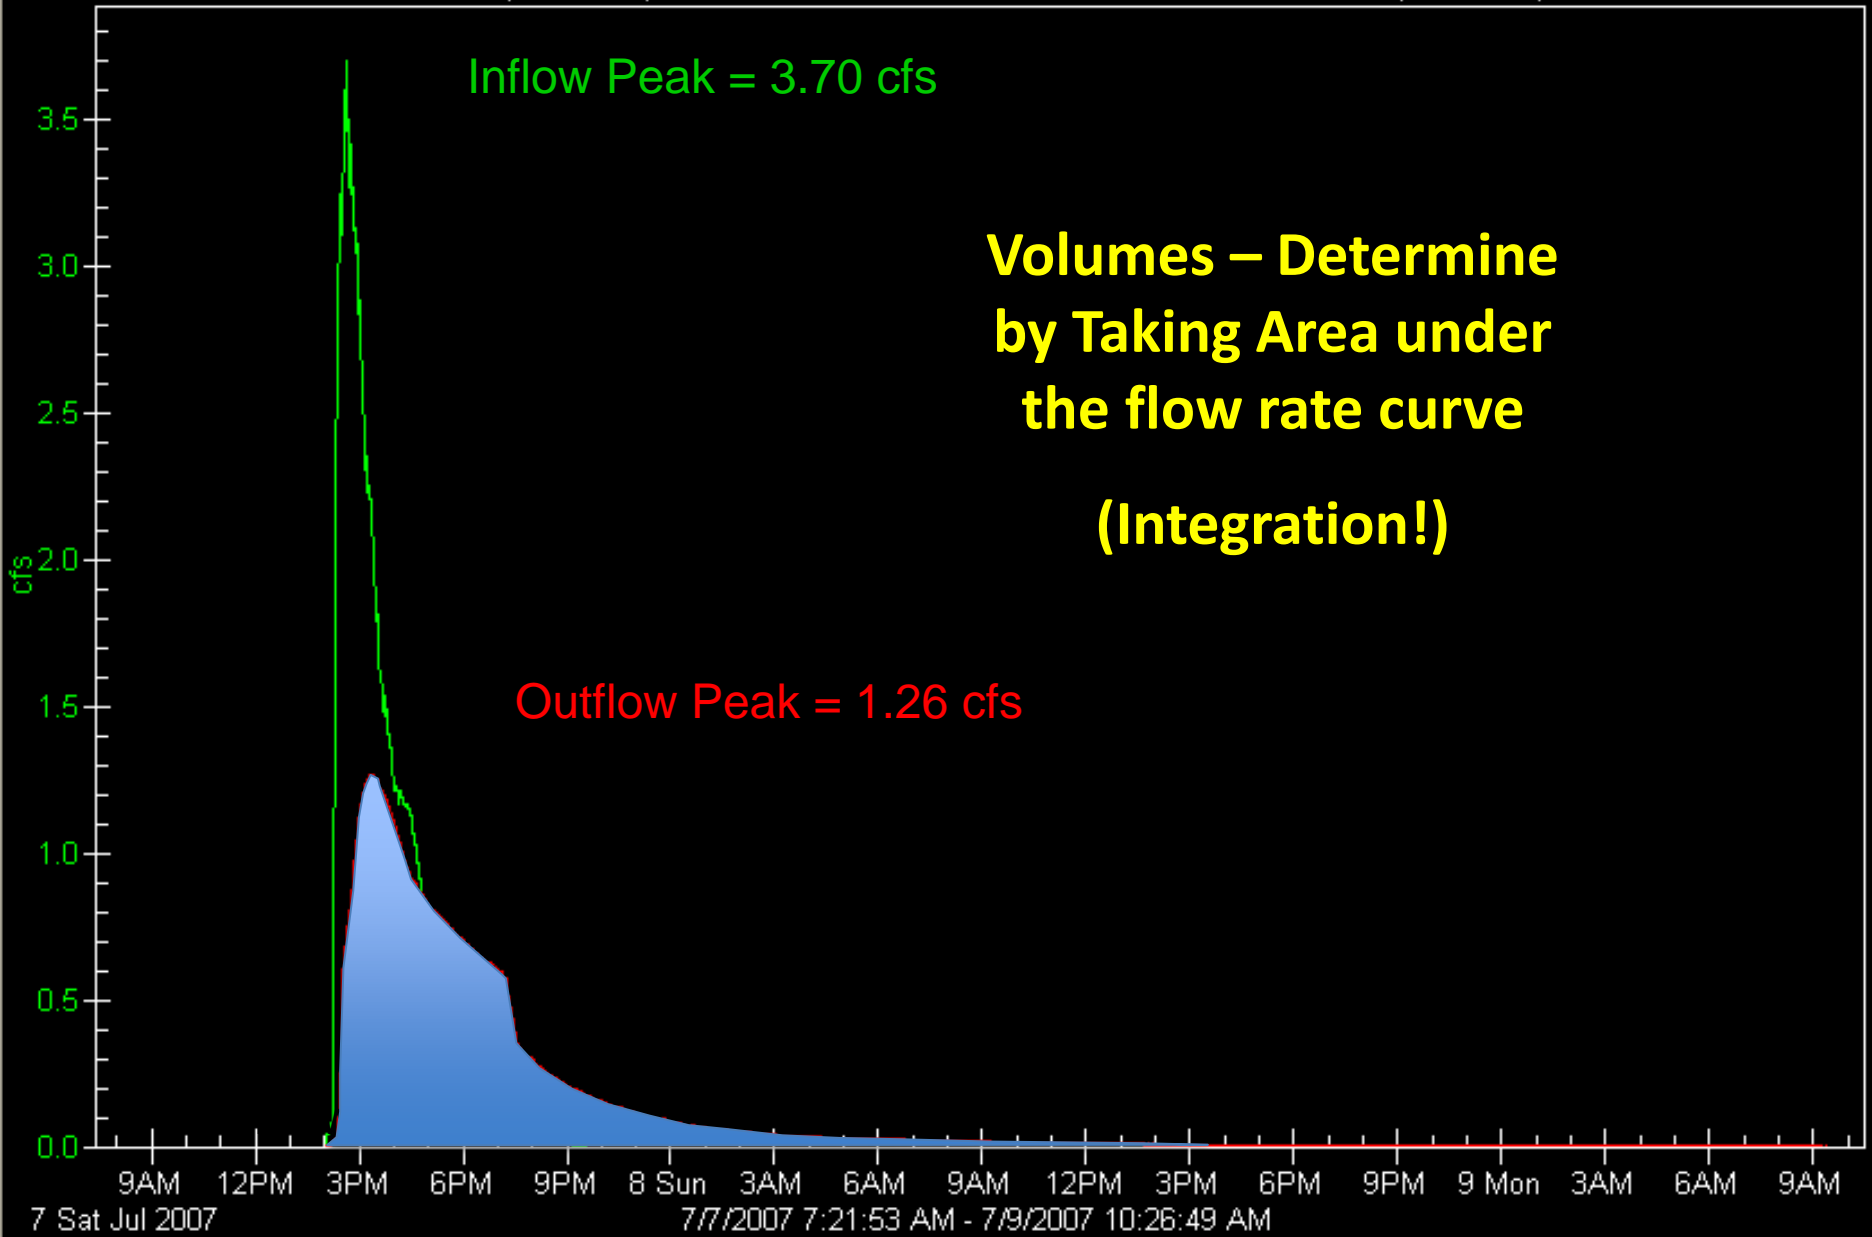

inflow (32683.9 cf)

outflow (24767.5 cf)

Inflow Peak = 3.70 cfs

Outflow Peak = 1.26 cfs

**Volumes – Determine  
by Taking Area under  
the flow rate curve  
(Integration!)**

# The Automated Sampler

The sampler “pulls” aliquots based on:

1. Flow Rates
2. Rainfall Rates
3. Time Intervals

This is how EMC's are measured/ calculated.

# OK, Let's look at the monitoring sites

(Please take mental note... Quiz following)

# Managed Pervious Surface Study Sites

- Woods
- Durham Co.
- HSG D
- Monitored since Feb '22

# Managed Pervious Surface Study Sites

- Woods
- NCMA, Wake Co.
- HSG B
- Monitored since Jan '23

# Managed Pervious Surface Study Sites

- Woods(?)
- Wilmington
- HSG A/B
- Monitored since Sep '22

# Pervious Surface Study Sites

- Meadow
- Duke Forest, Orange Co
- HSG D/C
- Monitored since Sep '22

# Managed Pervious Surface Study Sites

- Meadow
- NCMA,  
Wake Co.
- HSG B
- Monitored  
since Aug  
'22

# Pervious Surface Study Sites

- Managed Lawn
- NC State, Wake Co.
- HSG B
- Monitored since Mar '22

# Pervious Surface Study Sites

- Managed Lawn
- Veteran's Park, Wilmington
- HSG A
- Monitored since Aug '22

# What Site Produced Runoff Most Reliably?

# What Site Produced the Least Amount of Runoff?

## Guess How Many Storms Produced Runoff?

Includes 3.56" and 4.35" events

# Underlying Soil Really Matters!!!

- Score One (Big One) for the Curve Number Method!

# All other Sites have yielded at least 4 runoff-producing events

- Woods sites
  - Wet antecedent conditions, storms as small as 0.7” can trigger runoff
  - Normal ADP, runoff-producing storms > 1.0”
- Meadow sites
  - Typically need at least 1.0” of rainfall to generate runoff
- All (but NCSU lawn) had some storms > 1.5” that did not generate runoff

Table 20.4 Runoff Curve Numbers of Urban Areas (ARC II)

cover description	average percent impervious area	curve numbers for hydrologic soil			
		group A	group B	group C	group D

fully developed urban areas (vegetation established)

open space (lawns, parks, golf courses, cemeteries, etc.)

poor condition (grass cover < 50%) .....	68	79	86	89
fair condition (grass cover 50 to 75%) .....	49	69	79	84
good condition (grass cover > 75%) .....	39	61	74	80

right-of-way .....	98	98	98	98
paved; open ditches (including right-of-way) .....	83	89	92	93
gravel (including right-of-way) .....	76	85	89	91
dirt (including right-of-way) .....	72	82	87	89

western desert urban areas

natural desert landscaping (pervious areas only) .....	63	77	85	88
artificial desert landscaping (impervious weed barrier, desert shrub with 1 to 2 in sand or gravel mulch and basin borders) .....	96	96	96	96

urban districts

commercial and business .....	85	89	92	94	95
industrial .....	72	81	88	91	93

residential districts by average lot size

1/8 acre or less (townhouses) .....	65	77	85	90	92
1/4 acre .....	38	61	75	83	87
1/3 acre .....	30	57	72	81	86
1/2 acre .....	25	54	70	80	85
1 acre .....	20	51	68	79	84
2 acres .....	12	46	65	77	82

developing urban areas

newly graded areas (pervious areas only, no vegetation) .....	77	86	91	94

Average

• CN Calculation for 66-69

Reprinted from *Urban Hydrology for Small Watersheds*, Technical Release TR 55, United States Department of Agriculture, Soil Conservation Service, Table 2-2a, 1986.

# Antecedent Moisture Conditions Really Matter...

- Another “Win” for the Curve Number Method

# Let's Talk (Nutrient) Pollution!!!

# What is your guess at typical nutrient concentrations coming off parking lots?

- TN: 1.63 mg/L (mean).
  - Range: 1 to 2.5 mg/L
- TP: 0.21 mg/L
  - Range: 0.1 to 0.3 mg/L

# What land use yielded the highest nutrient concentrations?

- TN: 6.53 mg/L (!)
- TP: 1.56 mg/L (!!!)

# How do you think these other pervious landuses compare to (typical) asphalt runoff?

TN: 1.79 – 3.97 mg/L

TP: 0.37 – 0.58 mg/L

# How do you think these other pervious landuses compare to (typical) asphalt runoff?

TN: 0.84 – 1.49 mg/L

TP: 0.08 – 0.44 mg/L

These 2 sites have the fewest amount of data. One of which, only 2 WQ samples

# This Study will continue through next Spring

- These Data will support some significant re-vamping of SNAP
  - Curve Number- based hydrology in lieu of the Simple Method
  - Changes to nutrient concentrations assigned to pervious land uses

## A Curiosity...

- Some of the Biggest Storms had the highest concentrations...
- E.g., a 1.86 in event yielded a 6.85 mg/L TN concentration @ NCMA Woods
  - 50% higher than mean

# Tell Me About the Water Quality Storm (Please)

- What is it (in NC)?
- How do we treat it?

# When testing SCMs, we try to capture all storms b/w 0.25 & 2.0 in

# We (BAE Stormwater) Have a Fair Amount of Data

- Examined Data from 11 Sites
- Did Big Storms ( $\gg 1$  inch) carry a disproportional amount of load? Or
- Did capturing 1-in-ish events yield the clear majority of pollutant load?

# Cumulative TP Load, by Storm Rank

40% of Load, in 2 storms (3.8" & 5.4") 2 out of 18 storms

# Cumulative Loads, by Storm Rank

68% of Total Load in 1 storm, 3.76"      1 out of 12

# Cumulative TP Loads, by Storm Rank

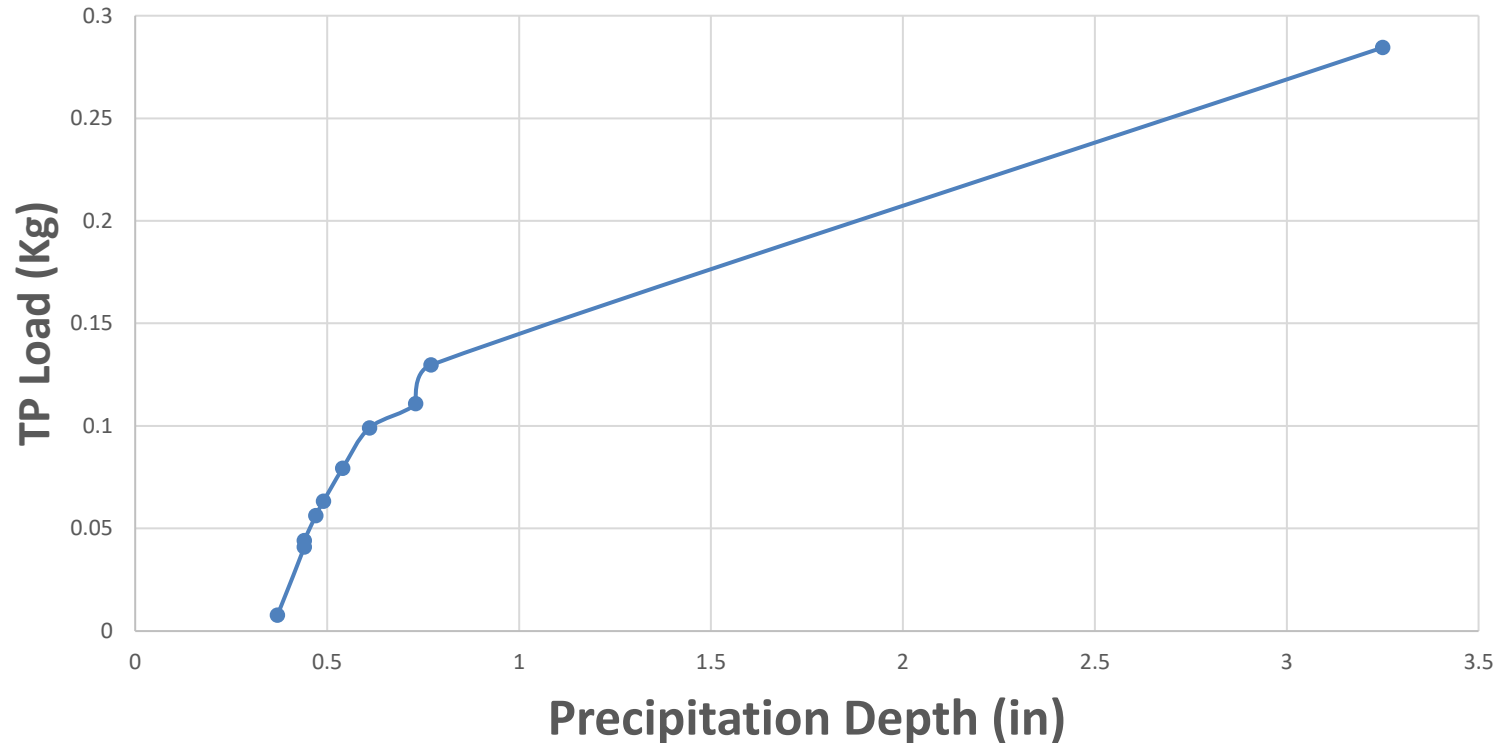

37% of Total Load in 1 storm, 5.4" 1 out of 14

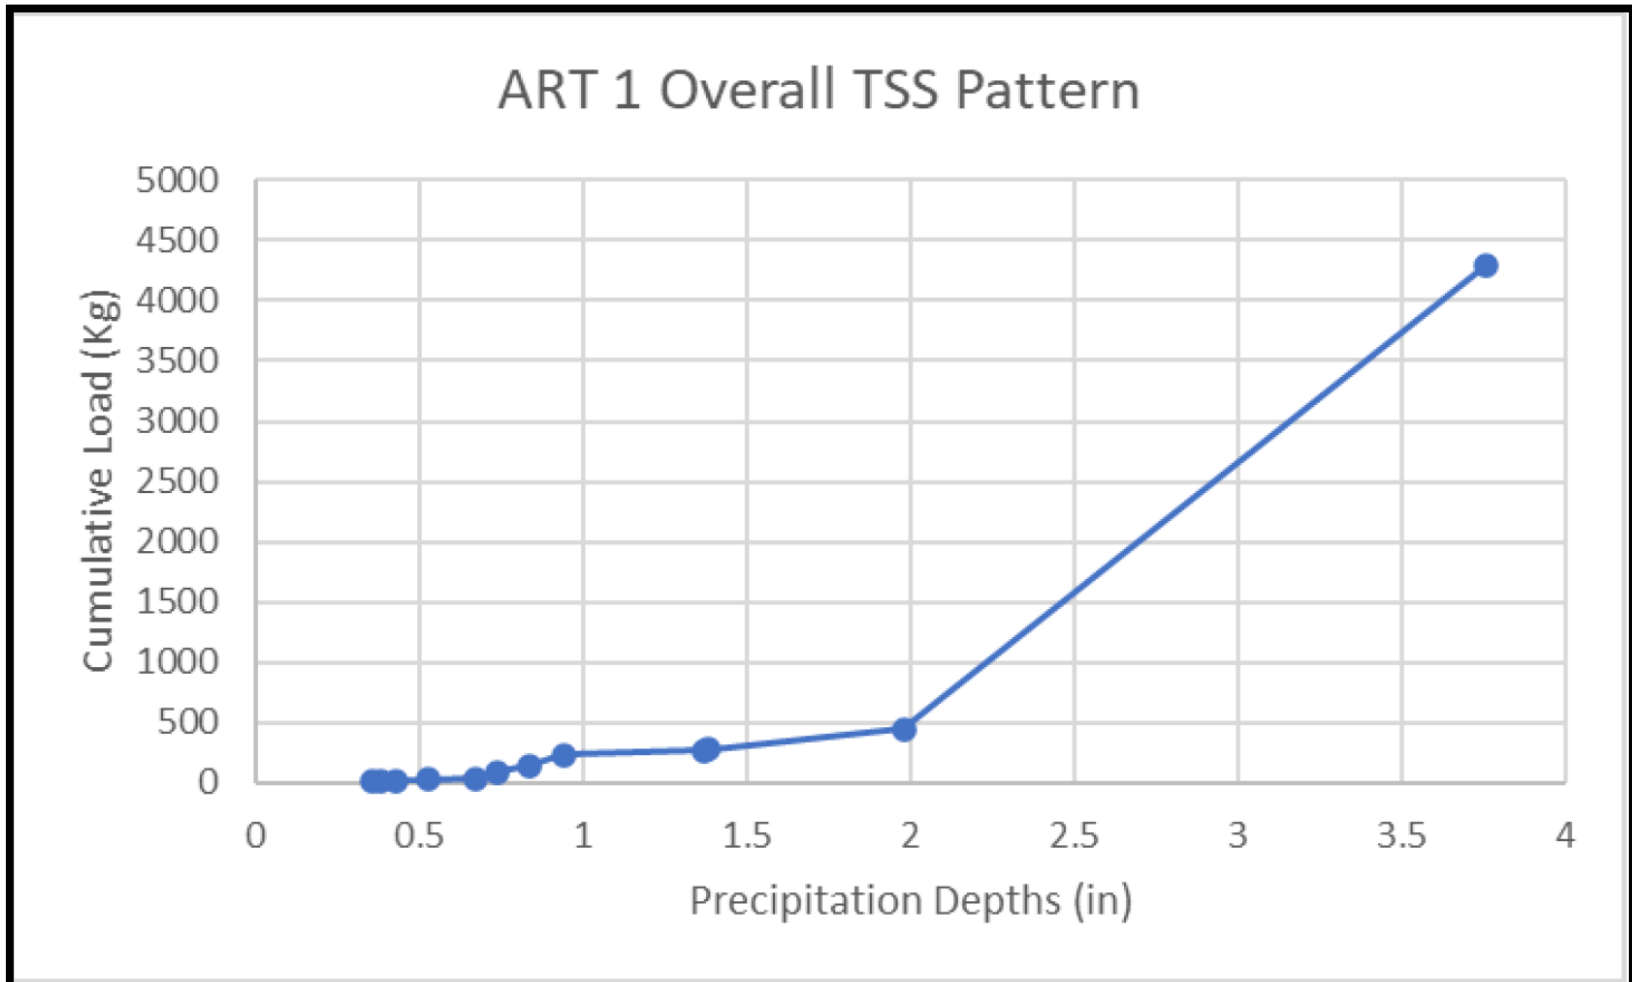

# Cumulative TP Loading, by Storm Rank

Cumulative TP Load, Cape Landing

- 54% of load in 1 storm (of 10). 3.25 in

# Cumulative TSS Loading, by Storm Rank

88% of Total TSS Load in 1 storm, 3.76 in

# Cumulative TSS Load, by Storm Rank

# Cumulative TSS Load, By Storm Rank

- 64% of TSS Load in 1 event (of 11). 5.45 in

# So... What Does This Mean For Us?

- If these data are reflective of “normal”...
- How effective is catching a 1.0” event, treating it, and letting the rest of the storm bypass?
  - Particularly for Nutrient Abatement

# Is the Future in Flow?

- Bioswales, like this one in Meck. Co, are designed for Flow Rates
- Not Capture Volumes

# Is the Future in Flow?

- Designing Wetlands like this one in Lenoir...
- Based on Flow Rates
- Not Capture Volumes

# Is the Future in Flow?

- Manufactured Treatment Devices are usually predicated on treating flow rates, not capture volumes.

# Is Catch & Release “Dead”?

- Nope.
- Limitations may exist for nutrient (& TSS) load treatment.
- NOT: Peak Flow Mitigation
- NOT: Healthy Stream Flows
- Perhaps not: other pollutants
- Perhaps not: ultra-urban sites
- Plus...

# Smart Controls!!!
